RATE THIS CHALLENGE

Given a dictionary of words dict where each word follows CamelCase notation, print all words in the dictionary that match with a given pattern consisting of uppercase characters only. CamelCase is the practice of writing compound words or phrases such that each word or abbreviation begins with a capital letter. Common examples include: "PowerPoint" and "WikiPedia", "GeeksForGeeks", "CodeBlocks", etc.

NOTE:The order should be such that the output strings should be sorted by the lexicographic order of their abbreviations. For strings with same abbreviations the strings should be sorted by the usual lexicographic order. So, if Output Strings are Hi and HelloWorld, Hi should come first as H lexicographically is smaller than HW.

Input Format

n=8 dict[]={Hi,Hello,HelloWorld,HiTech,HiGeek,HiTechWorld,HiTechCity,HiTechLab} pattern = HA

Constraints

1 <= N <= 100 1 <= length of pattern <= length of string <= 100

Output Format

No match found

Sample Input 0

```
8
Hi,Hello,HelloWorld,HiTech,HiGeek,HiTechWorld,HiTechCity,HiTechLab
HA
```

Sample Output 0

No match found

Sample Input 1

```
3
WelcomeGeek,WelcomeToGeeksForGeeks,GeeksForGeeks
WTG
```

Sample Output 1

WelcomeToGeeksForGeeks

```
1  # Enter your code here. Read input from STDIN. Print output to STDOUT
2  n = int(input())
3  ddict = input()
4  word_list = [item.strip() for item in ddict.split(',') ]
5  pattern = input()
6  matchi=0
7  for i in range(n):
8      word=[]
9      for j in range(len(word_list[i])):
10         ch=word_list[i][j]
11         if ch.isupper():
12             word.append(ch)
13         upper = "".join(word)
14         if pattern in upper:
15             print(word_list[i])
16             matchi=1
17             break
18  if matchi==0:
19     print("No match found")
20
21
22
```
